No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

The transposase the transposas is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by transposase useful for producing deletion derivatives of polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a transposon nucleic acid comprising a

The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a trarget nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a target nucleic acid the present sequence recognized sequence recognized by a contraining a containing a transposase; and recovering a target nucleic acid. The present sequence represents a Cat-Mu transposon modified end
transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three readings frames at least partly within a transposon end sequence recognized by a transposase; and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu(Stop)-transposon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ď
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   þ

Any interaction trained or distributed or detecting a mismatch in a test double stranded nucleic acid transposition of the Mu-end nucleic acid into the target, where transposition at the predominant site indicates the presence of mismatch at about that site. The methods are useful for typing a pathogenic microorganism strain, for screening an embryo for the presence of mismatch microorganism strain, for screening an embryo for the presence of interest, detecting the presence of known mutation in a gene of interest, and diagnosing the presence or absence of a tumour-promoting mutation. The kit is useful for detecting the presence of a number of nucleic nor polymorphism of interest in a nucleic acid molecule. The oligonucleotide MM1141.
                                                                                                                                                                                                                                                                            Detecting a mismatch in a test double stranded nucleic acid target, useful for typing a pathogenic microorganism strain, comprises detecting transposition of the Mu-end nucleic acid into the target.
                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of detecting a mismatch in a test

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid transposition reaction in the presence of a target nucleic acid transposon containing a genetically engineered translation stop sighal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu(Stop)-transposon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by a transposase useful for producing deletion derivatives of polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gapš
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection; transposition detection; pathogen typing; ning; mutation detection; Mu end DNA; MM1141.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1250 TGATTGATTGAAGGAAAAAGGGAAAGGGTTTCACGATAAATGCGAAAAC 1201

                                                                                                   The present invention relates to a method for making an insertional mutation at a random or quasi-random position in cellular nucleic acid in a aranger cell comprising introducing into the target cell a synaptic complex. The method is particularly useful for efficiently inserting a transposable polynucleotide at random or quasi-random locations in the chromosomal or extra-chromosomal nucleic acid of a target cell. The method may also be used for screening the genome of cells that comprise an insertional mutation that induces a phenotypic or genotypic change relative to the cells that are not subject to insertional mutagenesis. The present sequence is the precut transposon end of Bacteriophage Mu non-transferred strand, used in the exemplification of the invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1. .4

The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a target nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by a transposase useful for producing deletion derivatives of polypeptide.

acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a \operatorname{Cat-Mu} transposon containing wild
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of detecting a mismatch in a test double stranded nucleic acid target which comprises detecting transposition of the Mu-end nucleic acid into the target, where transposition at the predominant site indicates the presence of mismatch at about that site. The methods are useful for typing a pathogenic microorganism strain, for screening an embryo for the presence of mutation, for detecting the presence of known mutation in a gene of interest, detecting the presence of known mutation in a gene of interest, and diagnosing the presence or absence of a tumour-promoting mutation. The kit is useful for detecting the presence of a mutation or polymorphism of interest in a nucleic acid molecule. The present sequence represents the Mu end DNA fragment construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting a mismatch in a test double stranded nucleic acid target, useful for typing a pathogenic microorganism strain, comprises detecting transposition of the Mu-end nucleic acid into the target.

```

```
The invention relates to a Mu-like transposable element (I) used for generating functional fusion proteins after insertion into a target DNA. The Mu-like element comprises: (a) a left transposable element attachment and attR; (c) after insertion of the transposable element into a target DNA sequence, a fusion mRNA sequence is transcribed originating either from the target DNA on either side of the transposable element or from inside the transposable element and continuing through the attachment site sequences and into the protein coding region, resulting in a single fusion open reading frame (ORF). The constructs are useful in the development of a protein domain library, in the construction of multicunctional enzymes and in the accelerated evolution of new enzymatic activities. The sequences AAZ28804 represent deletion mini-Mu elements of the invention (encoded ORF - AAX55901-Y55906)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Generating fusion proteins using transposable elements, useful for development of a protein domain library and in the construction of multifunctional enzymes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a Mu-like transposable element (I) used for generating functional fusion proteins after insertion into a target DNA. The Mu-like element comprises: (a) a left transposable element attachment attendent attachment attendent attachment attendent attachment attendent attachment attendent attachment attendent attachment and attra. (c) after insertion of the transposable element into a target DNA sequence, a fusion many sequence is transcribed originating either from the target DNA on either side of the transposable element or from into attachment site sequences and into the protein coding region, resulting in a single fusion open reading frame (ORF). The constructs are useful in the development of a protein domain library, in the construction of multicactional enzymes and in the accelerated evolution of multicactivities. The sequences AAZ28884 represent deletion mini-Mu elements of the invention (encoded ORF - AAY55901-Y55906)

The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence comprising a transposon sequence and a DNA recombination sequence comprising a transposon sequence and a DNA recombination sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                               Preparing a targeting construct using a transposon and DNA recombination sequence, useful in making a targeting vector capable of modifying plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transposon Mu; transposable element; fusion protein; attachment site; attL; attR; protein domain library; enzyme; accelerated evolution; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to a Mu-like transposable element (I) used for generating functional fusion proteins after insertion into a target DNA. The Mu-like element comprises: (a) a left transposable element attachment site attL and a right transposable element attachment site attR, where attR is no more than 62 nucleotides long; (b) a site for insertion of an exogenous DNA sequence encoding for a protein domain located between attL and attR; (c) after insertion of the transposable element into a target DNA sequence, a fusion mRNA sequence is transcribed originating either from the target DNA on either side of the transposable element or from inside the transposable element and continuing through the attachment site sequences and into the protein coding region, resulting in a single fusion open reading frame (ORF). The constructs are useful in the development of a protein domain library, in the construction of multicunctional enzymes and in the accelerated evolution of new enzymatic activities. The sequences AAZZ8884 represent deletion mini-Mu elements of the invention (encoded ORF - AAYS5901-YSS906)
                                                                                                                                                                                              Generating fusion proteins using transposable elements, useful for development of a protein domain library and in the construction of multifunctional enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 83 BP; 17 A; 19 C; 18 G; 29 T; 0 U; 0 Other;

Preparing a targeting construct using a transposon and DNA recombination

```
The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence in vitro, inserting a DNA sequence comprising a transposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention
sequence, useful in making a targeting vector capable of modifying plant and/or animal genome in a predetermined way.

HVCDNA0014 (Blumeria infected)"

Anotes-Weetor: pBluescript SK(-); Site_1: ECORI; Site_2: Morex (mla) plants were greenhouse grown in the R Wise lab at lows State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria grammins f. sp. hordei, and leaves were harvested Blumeria grammins f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA plagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer,
                                                                                                                                                                                                    ö

Blumeria graminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in vivo exclised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or

//note="Vector: pBluescript SK(-); Site_1: ECORI; Site_2: Xhof; Morex (mla) plants were greenhouse grown in the R Wise lab at lowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria grammins f: sp. hordei, and leaves were harvested grammins f: sp. hordei, and leaves were harvested lin the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA plagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Ming). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing) Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or

/loo hose="locklaim" vulgare green seedling EST library //loo hose="locklaim" vulgare green seedling EST library HVCDNAOO14 (Blumeria infected)"
//note="Wector: pBluescript SK(-); Site_1: ECORI; Site_2: Khoi; Morex (mla) plants were greenhouse grown in the R Wise lab at Iowa State University, Ames, IS; 7 day old green seedlings were infected with isolate 5874 of Blumeria grammins f. sp. hordei, and leaves were harvested Blumeria grammins f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequence and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HVSMEm0015C18f Hordeum vulgare green seedling EST 19-OCT-2001 HVCDNA0014 (Blumeria infected) Hordeum vulgare subsp. vulgare cDNA clone HVSMEm0015C18f, mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

//note="Vector: pBluescript SK(-); Site_1: BCORI; Site_2: Xho1; Morex (mla) plants were greenhouse grown in the R Wise lab at Iowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria gramminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Akkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /dlone lib="Horden vulgare green seedling EST library //lone lib="Wetcror: pBluescript SK(-); Site 1: ECORI; Site 2: KhOI; Morex (mla) plants were greenhouse grown in the R Wise lab at lowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria graminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TV Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified CDNA library was made, and I million pffu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum Palmer; Frisch, Akkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Hearth, Akkins and Wing). Plasmid DNA preparation and contains a minimum of 100 bases of phred value 20 or seminore analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
